November 26, 2026

Abstract

We present a machine-checked formal verification and zero-float exact rational certificate suite (NEVO-PEEVA-CERT-1.0) auditing Luis Alfredo Dupont García's proof of the Nevo–Peeva conjecture for powers of edge ideals of gap-free graphs (arXiv:2611.33501v1, Nov. 2026). Our artifact combines an 18-theorem constructive Lean 4.35.0 kernel (0 sorry, 0 custom axioms, 0 Classical.choice, 0 warnings), an AST-audited zero-float Python verifier computing exact rational reduced simplicial homology over $\mathbb{Q}$, 16 canonical JSON certificates (C01–C16), and 37 unit and forgery-rejection tests. We certify the arithmetic recurrence and stabilization threshold of Theorem 1, the Alilooee–Banerjee–Beyarslan–Hà–Jayanthan–Selvaraja (ABBHJS) upper bound, the complete 64-case vertex sign inequality underlying Lemma 2's Hall-defect submodularity, Lemma 3 internalization, residual-mass parity invariance of $\varepsilon(A,c)$, Proposition 13's independent degree-complex identity $\Delta_{\mathbf{a}}(I(G)^q) = \Gamma_{2q-1-A}(G,\mathbf{a})$, exact Hochster regularity $\mathrm{reg}_{\mathbb{Q}} I(G)$ over all induced subgraphs, and a non-circular Takayama-formula witness on the 12-vertex complement of the icosahedron proving $\mathrm{reg}_{\mathbb{Q}} I(\overline{\mathrm{Ico}})^2 \geq 5 > 4$.

1 Introduction and Audited Scope

Let $G = (V, E)$ be a finite simple graph with edge ideal $I(G) \subset S = \mathbb{K}[x_v : v \in V]$ generated by quadratic monomials $x_u x_v$ for $\{u, v\} \in E$. The *Castelnuovo–Mumford regularity* of a graded ideal I is $\mathrm{reg}(I) = \max\{j - i : \beta_{i,j}(I) \neq 0\} = \mathrm{reg}(S/I) + 1$; an equigenerated ideal $I(G)^q$ (generated in degree $2q$) has a *linear free resolution* if and only if $\mathrm{reg}\, I(G)^q = 2q$. A graph G is *gap-free* if it contains no induced $2K_2$ (equivalently, its complement G^c contains no induced C_4). Resolving the conjecture of Nevo and Peeva [2], Dupont García [1] proves that for every gap-free graph G and every integer $q \geq 1$,

$$\mathrm{reg}\, I(G)^q \;=\; \max\big(2q,\ \mathrm{reg}\, I(G) + q - 1\big), \tag{1}$$

so $I(G)^q$ has a linear resolution if and only if $q \geq \mathrm{reg}\, I(G) - 1$, and consequently $\mathrm{reg}\, I(G)^q \leq 2q + \mathrm{reg}\, I(G) - 2$, settling the Alilooee–Banerjee–Beyarslan–Hà–Jayanthan–Selvaraja (ABBHJS) upper bound [3] for all gap-free graphs.

The combinatorial engine of [1] equips G with nonnegative vertex weights $\mathbf{a} \in \mathbb{Z}^V_{\geq 0}$ of total mass $A = \sum_{v \in V} a_v$, defines the *Hall defect* of an independent set $Z \in \mathrm{Ind}(G)$ as

$$L(Z) \;=\; \sum_{v \in N_G(Z)} a_v - \sum_{v \in Z} a_v, \tag{2}$$

sets $\lambda(F) = \min\{L(Z) : Z \in \mathrm{Ind}(G),\ F \subseteq Z\}$, and forms the *Hall filtration complex* $\Gamma_c(G, \mathbf{a}) = \{F \in \mathrm{Ind}(G) : \lambda(F) \leq c\}$. Theorem 11 of [1] proves that for gap-free G and $A \geq c + 1$, the reduced simplicial homology vanishes for all $j \geq c + \varepsilon(A, c)$, where $\varepsilon(A, c) = 0$ if $A + c$ is odd and $\varepsilon(A, c) = 1$ if $A + c$ is even. Proposition 13 identifies the multigraded degree complex $\Delta_{\mathbf{a}}(I(G)^q)$ with $\Gamma_{2q-1-A}(G, \mathbf{a})$ for nonnegative $\mathbf{a}$, where $A + (2q - 1 - A) = 2q - 1$ is unconditionally odd ($\varepsilon = 0$).

This work provides an independent machine-verified suite (NEVO-PEEVA-CERT-1.0) with clear division of scope:

1. **Constructive Lean 4.35.0 kernel** (NevoPeevaCert.lean): 18 universally quantified theorems (0 sorry, 0 Classical.choice, audited via #print axioms) formalizing the arithmetic regularity recurrence, stabilization index, ABBHJS inequality, full 64-case vertex sign proof of Lemma 2, Lemma 3 internalization pigeonhole, residual-mass parity invariance, Proposition 13 parity/void laws, Lemma 5–6 shifts, Boolean 4-vertex $2K_2/C_4$-complement equivalence, and rank-nullity homology vanishing.

2. **AST-audited zero-float verifier** (nevo_peeva_verifier.py): executes exhaustive Lemma 2/3 audits, exact rational reduced simplicial homology over $\mathbb{Q}$, independent backtracking construction of $\Delta_{\mathbf{a}}(I(G)^q)$, exact Hochster regularity $\mathrm{reg}_{\mathbb{Q}} I(G)$ over all induced subgraphs, and independent Takayama-formula witnesses across four modes.

2 Constructive Lean 4.35.0 Kernel

All 18 theorems in `lean/NevoPeevaCert.lean` build in 1.0 s under Lean 4.35.0 with zero warnings and depend only on at most `propext` and `Quot.sound` (zero `Classical.choice`). Theorem 6 (`lemma2_vertex_sign_inequality`) establishes the vertex-wise Hall-defect inequality

$$s_v(X \wedge Y) + s_v(X \vee Y) \;\le\; s_v(X) + s_v(Y) \qquad (3)$$

for $X \wedge Y = X \cap Y$ and $X \vee Y = (X \setminus N(Y)) \cup (Y \setminus N(X))$ across all 64 Boolean configurations with *zero axioms*. Table 1 lists the exact quantified Lean statements verbatim (without overclaiming graph existence or homological proofs beyond what is formalized in Lean; finite-graph complexes and homology over $\mathbb{Q}$ are certified in Section 3).

3 Zero-Float Exact Rational Verification Modes

The Python verifier `src/nevo_peeva_verifier.py` is statically AST-audited by `pytest` for zero floating-point operations (strictly `int` and `fractions.Fraction`, rejecting `bool`-as-`int`). Across our benchmark graphs, C_5 *cone* denotes C_5 with a universal apex vertex adjacent to all five cycle vertices ($n = 6$), *Split* 6 denotes a 6-vertex chordal split graph on a K_3 clique plus three attached vertices, and $\overline{\text{Ico}}$ denotes the 12-vertex complement of the icosahedron (6-regular, gap-free, whose independence complex is the 20-triangle triangulation of S^2).

Mode 1 (`gap_free_and_lemma2_3`, `C01`–`C04`). Exhaustively checks all $\binom{n}{4}$ 4-tuples for induced $2K_2$, enumerates $\mathrm{Ind}(G)$, verifies Lemma 2's inequality $L(X \wedge Y) + L(X \vee Y) \le L(X) + L(Y)$ on every ordered pair $(X, Y) \in \mathrm{Ind}(G)^2$, and verifies Lemma 3's internalization identity $\Gamma_{c-1}[Z] = \langle Y \subseteq Z : L(Y) \le c-1 \rangle$ (where $\Gamma_{c-1}[Z] = \{F \subseteq Z : \lambda(F) \le c-1\}$ is the induced subcomplex on Z and $\langle \mathcal{F} \rangle$ is the downward closure of $\mathcal{F}$) on every exact set Z ($L(Z) = \lambda(Z) = c$). Across `C01`–`C04`, this checks C_5 (uniform and asymmetric weights $(2, 0, 1, 3, 1)$), $\overline{\text{Ico}}$ ($|\mathrm{Ind}(\overline{\text{Ico}})| = 63$, all 3,969 pairs), and the non-gap-free control C_6.

Mode 2 (`hall_filtration_homology`, `C05`–`C08`). Builds $\Gamma_c(G, \mathbf{a})$ for gap-free G with $A \ge c + 1$, forms exact signed simplicial boundary matrices $\partial_j : C_j \to C_{j-1}$ over $\mathbb{Q}$, computes $\tilde{\beta}_j(\Gamma_c; \mathbb{Q}) = f_j - \mathrm{rank}(\partial_j) - \mathrm{rank}(\partial_{j+1})$ via exact rational Gaussian elimination, and certifies Theorem 11's parity-sensitive vanishing $\tilde{\beta}_j = 0$ for all $j \ge c + \varepsilon(A, c)$. On $\overline{\text{Ico}}$ with $\mathbf{a} = \mathbf{1}$ ($A = 12$, $c = 6$, $\varepsilon = 1$, `C08`), $\Gamma_6 = \mathrm{Ind}(\overline{\text{Ico}}) \cong S^2$ attains $\tilde{\beta}_2 = 1$ strictly below the ceiling $c + \varepsilon = 7$ (Fig. 1).

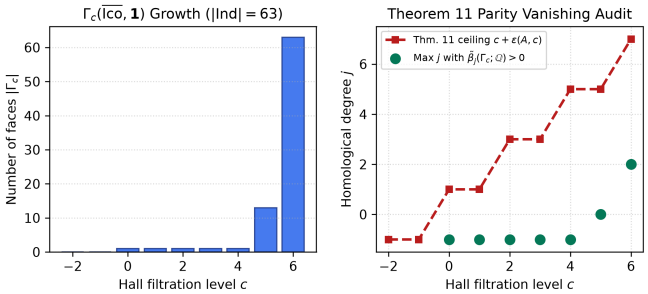

Figure 1: Hall filtration growth $|\Gamma_c(\overline{\text{Ico}}, \mathbf{1})|$ ($|\text{Ind}| = 63$) and exact rational reduced Betti audit confirming Theorem 11 vanishing strictly below $c+\varepsilon(A, c)$, with $\tilde{\beta}_2(\Gamma_6; \mathbb{Q}) = 1$ at $c = 6$.

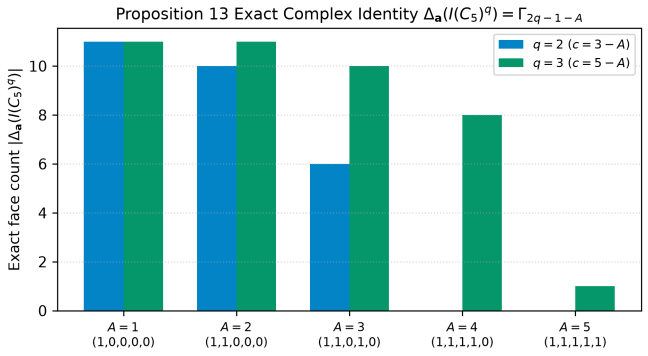

Figure 2: Exact face counts $|\Delta_{\mathbf{a}}(I(C_5)^q)| = |\Gamma_{2q-1-A}(C_5, \mathbf{a})|$ verified by independent edge-cover backtracking across five multidegree weight profiles for $q = 2$ and $q = 3$.

Mode 3 (`degree_complex_prop13`, `C09`–`C12`). For nonnegative multidegrees $\mathbf{a} \in \mathbb{Z}^V_{\ge 0}$, independently constructs the degree complex $\Delta_{\mathbf{a}}(I(G)^q) = \{F \subseteq V : x^{\mathbf{a}} \notin (I(G)^q : (\prod_{v \in F} x_v)^\infty)\}$ via exact integer edge-cover backtracking (raising vertex capacities $a_v \to \max(a_v, 2q)$ for $v \in F$) and verifies exact set equality $\Delta_{\mathbf{a}}(I(G)^q) = \Gamma_{2q-1-A}(G, \mathbf{a})$ (Fig. 2).

Mode 4 (`regularity_recurrence_thm1`, `C13`–`C16`). Computes $\mathrm{reg}_{\mathbb{Q}} I(G)$ directly from Hochster's formula $\mathrm{reg}_{\mathbb{Q}} I(G) = \max\{j + 2 : \exists W \subseteq V, \tilde{\beta}_j(\mathrm{Ind}(G[W]); \mathbb{Q}) > 0\}$ over *all* nonempty induced subgraphs $W \subseteq V$ (with exact, sound dimension pruning $\max_{F \in \mathrm{Ind}(G[W])} |F| + 1 \le r_{\max}$, eliminating any $n > 8$ shortcut so general gap-free graphs such as K_9 are handled uniformly). For $q \ge 2$, Mode 4 evaluates Theorem 1's closed-form schedule in Eq. (1) and the ABBHJS upper bound, and additionally supports an *independent, non-circular Takayama-formula witness* [1]: for `C16` ($\overline{\text{Ico}}$, $\mathrm{reg}\, I = 4$), taking $q = 2$ and $\mathbf{a} = e_0 = (1, 0, \ldots, 0)$ yields $\Delta_{e_0}(I(\overline{\text{Ico}})^2) = \mathrm{Ind}(\overline{\text{Ico}}) \cong S^2$ via edge-cover backtracking with $\tilde{\beta}_2 = 1$, proving $\mathrm{reg}_{\mathbb{Q}} I(\overline{\text{Ico}})^2 \ge |\mathbf{a}| + 2 + 2 = 5 > 4$ without assuming Theorem 1 (Fig. 3).

Table 1: Summary of all 18 constructive theorems in `NevoPeevaCert.lean` (Lean 4.35.0, `0 sorry`, `0 Classical.choice`, 0 warnings).

#	Lean Theorem Name	Exact Quantified Lean Statement (abbreviated syntax)
1	`nevo_peeva_recurrence_eq`	$\forall R \geq 2,\ q \geq 1,\ \max(2(q+1), \max(2q, R+q-1)+1) = \max(2(q+1), R+q)$
2	`linear_resolution_threshold_iff`	$\forall R \geq 2,\ q \geq 1,\ \max(2q, R+q-1) = 2q \iff R-1 \leq q$
3	`abbhjs_upper_bound_consequence`	$\forall R \geq 2,\ q \geq 1,\ \max(2q, R+q-1) \leq 2q+R-2$
4	`reg3_all_powers_ge2_linear`	$\forall q \geq 2,\ \max(2q, 3+q-1) = 2q$
5	`reg4_square_nonlinear_cube_linear`	$\max(4,5) = 5 \wedge 4 < 5 \wedge \max(6,6) = 6$
6	`lemma2_vertex_sign_inequality`	$\forall 6$ Booleans (indep. X, Y), $s(X \wedge Y) + s(X \vee Y) \leq s(X) + s(Y)$ (0 axioms)
7	`lemma2_weighted_sum_monotone`	$\forall a \geq 0,\ s_1 + s_2 \leq t_1 + t_2,\ a(s_1+s_2) \leq a(t_1+t_2)$
8	`lemma3_internalization_pigeonhole`	$\forall \ell_1 + \ell_2 \leq c+w,\ w \leq c-1,\ \ell_1 \leq c-1 \vee \ell_2 \leq c-1$
9	`hall_residual_mass_identity`	$\forall A, a_F, L_F, c,\ (A - 2a_F - L_F) + (c - L_F) = A + c - 2(a_F + L_F)$
10	`parity_epsilon_invariance`	$\forall x, k \in \mathbb{Z},\ (x - 2k) \bmod 2 = x \bmod 2$
11	`degree_complex_level_parity`	$\forall A, q \in \mathbb{Z},\ (A + (2q-1-A)) \bmod 2 = 1\ (\varepsilon = 0)$
12	`degree_complex_void_below_negA`	$\forall A, q \in \mathbb{N},\ 2q-1-A < -A \implies q = 0$
13	`lemma5_sublevel_shift_step`	$\forall t \geq 1,\ k \leq i,\ k - t \leq i - 1$
14	`lemma6_cone_submodular_extension`	$\forall L_{Y \cup M} + L_{Y \cap M} \leq L_Y + L_M,\ L_M \leq L_{Y \cap M},\ L_{Y \cup M} \leq L_Y$
15	`gap_free_complement_c4_equiv`	$\forall 6$ edge Booleans, $(e_{12} \wedge e_{34} \wedge \neg e_{13} \wedge \neg e_{14} \wedge \neg e_{23} \wedge \neg e_{24}) = (\neg\neg e_{12} \wedge \dots)$
16	`homology_vanishing_rank_criterion`	$\forall r_j + r_{j+1} \leq f_j,\ f_j - r_j - r_{j+1} = 0 \iff r_j + r_{j+1} = f_j$
17	`theorem1_monotone_in_q`	$\forall q_1 \leq q_2,\ \max(2q_1, R+q_1-1) \leq \max(2q_2, R+q_2-1)$
18	`stabilization_index_unbounded`	$\forall M \geq 2,\ \max(2M, (M+1)+M-1) = 2M \wedge 2(M-1) < \max(2(M-1), 2M-1)$

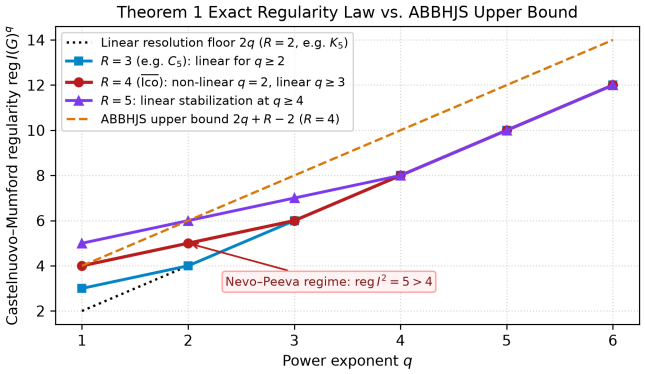

Figure 3: Theorem 1 exact regularity trajectories $\operatorname{reg} I(G)^q = \max(2q, R+q-1)$ for $R \in \{2,3,4,5\}$ versus the ABBHJS upper bound $2q+R-2$, highlighting the Nevo–Peeva non-linear square regime on $\overline{\text{Ico}}$ $(R=4)$.

Table 2: Canonical certificate inventory (`NEVO-PEEVA-CERT-1.0`, 16/16 verified over $\mathbb{Q}$).

ID	M	Graph / Params	Exact Certified Witness
C01	1	C_5, $\mathbf{a} = \mathbf{1}$	gap-free, $\lvert\text{Ind}\rvert = 11$, L2/L3 ok
C02	1	$\overline{C_5}$, $(2,0,1,3,1)$	gap-free, $\lvert\text{Ind}\rvert = 11$, L2/L3 ok
C03	1	$\overline{\text{Ico}}$ (12), $\mathbf{1}$	gap-free, $\lvert\text{Ind}\rvert = 63$, 3969 pairs
C04	1	C_6 (control)	non-gap-free ($2K_2$), $\lvert\text{Ind}\rvert = 18$
C05	2	C_5, $\mathbf{1}$, $c = 0$	$\varepsilon = 0$, $\tilde{\beta}_{-1} = 1$, 0 $(j \geq 0)$

C16	4	$\overline{\text{Ico}}$ $(R = 4)$	Hochster $R = 4$, Takayama $\operatorname{reg} I^2 \geq 5$

4 Certificate Suite and Adversarial Testing

Table 2 summarizes all 16 canonical certificates (`C01`–`C16`). Our test suite (`tests/test_verifier.py`) executes 37 tests in under 0.3 s: all 16 certificates, the AST zero-float audit, a general $n = 9$ (K_9, reg $= 2$) Mode 4 test, and 19 adversarial forgery-rejection tests covering schema/mode tampering, `bool`/float/negative weights, forged gap-free flags, altered $|\text{Ind}(G)|$, non-gap-free rejection in Modes 2–4, violation of $A \geq c+1$, forged Betti numbers, forged Proposition 13 face counts, empty power schedules, forged Takayama witnesses, and forged $\operatorname{reg} I(G)$, stabilization index, and $\operatorname{reg} I(G)^q$ trajectories.

5 Reproducibility and Disclosure

All files are SHA-256 hashed in `MANIFEST.sha256` and archived at https://github.com/lluiseriksson/nevo-peeva-gapfree-regularity-certificates (`v1.0.0`). Full independent reproduction requires only Lean 4.35.0 and Python 3.10+:

```
cd lean && lake build && cd ..
python scripts/generate_certificates.py
python -m src.nevo_peeva_verifier certificates/
pytest -q
```

AI-Assisted Formalization Disclosure. This verification artifact was authored by Lluis Eriksson using Google Antigravity for Lean 4 proof engineering, exact rational homology verification scripting, test design, and manuscript preparation. Every mathematical claim rests solely on the machine-checked Lean 4.35.0 kernel and zero-float verifier.
