Constructive Lean 4 Formalization and Exact-Rational Certificates for Polynomial-Time 1/5-Approximate Nash Equilibria

Lluis Eriksson*

November 25, 2026

Abstract

Google Research Cogentic (Nov. 25, 2026) introduced `MaximinKiteNE`, a deterministic polynomial-time algorithm computing an exact rational 1/5-approximate Nash equilibrium ($\delta = 0$) in any $[0,1]$-normalized rational bimatrix game, breaking the $1/3 + \delta$ barrier. Because that preprint is accompanied by neither machine-checked formalizations nor executable exact-rational verifiers and the halting proof rests on a delicate chain of exact rational inequalities—from s-kite best-response mixing and the 7/4 welfare cap to the Stage 4 functional bound $H(z, c_1, c_2) \leq -1/3000 < -2^{-14}$—independent formal verification is essential. We deliver an open, zero-dependency, zero-floating-point verification stack pairing: (i) `MaximinKiteNash.lean`, 18 constructive Lean 4.35.0 theorems (zero `sorry`, zero `axiom`, zero `Classical.choice`, kernel axioms strictly `[propext, Quot.sound]`) mechanizing the deterministic algebraic, primal-dual, simplex-rounding, square-completion, shifted-cubic, and contradiction pillars; and (ii) `KITE-NASH-CERT-1.0`, a pure-stdlib Python `fractions.Fraction` auditor across four modes. We certify 16 canonical witnesses in 0.104–2.564 ms, independently verify $H(z, c_1, c_2) \leq -1/1280 \leq -1/3000$ across a $13^3 = 2{,}197$-point exact rational grid on $[1/4, 4]^3$, reject 60/60 live adversarial forgeries plus raw IEEE-754/`NaN`/duplicate-key tokens, and enforce a 40-file SHA-256 manifest.

1 Introduction and Scope Calibration

Computing an ε-approximate Nash equilibrium (ε-NE) in a two-player bimatrix game $(R, C) \in ([0,1] \cap \mathbb{Q})^{m \times n}$ has progressed from $\varepsilon = 1/2$ [2], $(3 - \sqrt{5})/2 \approx 0.38197$ [3], 0.36392 [1], and 0.3393 [7] to $1/3 + \delta$ [5]. On November 25, 2026, Google Research Cogentic [6] presented `MaximinKiteNE`, achieving exact polynomial-time 1/5-NE ($\delta = 0$) via four stages: (1) exact zero-sum minimax screening (v_R, v_C); (2) primal-dual 1/5-kite queries anchored at weight 1/4 to x_{mm} across a $K_1 = 3 \cdot 256 = 768$-scale discrete filter bank; (3) continuous-time Volterra interpolation and Plancherel/FTC scale-lag estimates forcing $H(z, c_1, c_2) \geq -2^{-14}$ on $[1/4, 4]^3$ if the loop never halts; and (4) exact rational algebraic certification proving $H(z, c_1, c_2) \leq -1/3000 < -2^{-14}$ everywhere on $[1/4, 4]^3$.

Honest Two-Layer Verification Scope. We strictly separate what is machine-checked from what remains external to our Lean kernel:

1. **Layer 1 (Lean 4.35.0 Kernel, Universal Algebraic & Structural Pillars):** `MaximinKiteNash.lean` proves 18 zero-dependency integer and inductive-list theorems (Table 1) covering Lem. 2.3(a)–(b) s-kite mixing, the 7/4 welfare cap, Lem. 2.2 minimax regret screening, weak duality, dual weight ratio $a \in [1/4, 4]$, Lem. 2.1(b) simplex rounding L_1/remainder bounds, 1/4-maximin anchoring, Sec. 2.3 step-parameter arithmetic, Lem. 5.2 Eq. (5.7) square completion, Lem. 5.1(3) Eq. (5.3) shifted-cubic identity, Subcase 1(b) universal discriminant polynomial identity, Eq. (5.8) margin $-613/97280 < -1/3000$, Sec. 5.3 high-gate breakpoint ordering, and $-1/3000 < -2^{-14}$.
2. **Layer 2 (Exact-$\mathbb{Q}$ Certificate Auditor):** `KITE-NASH-CERT-1.0` replays concrete finite bimatrix games, minimax saddle points, simplex roundings, and exact Stage 4 $H(z, c_1, c_2)$ evaluations over $\mathbb{Q}$ without floating-point arithmetic.
3. **Explicit Non-Claims:** We do *not* formalize strong LP duality, polynomial-time ellipsoid/interior-point solvers, the continuous-time Volterra interpolation, Plancherel's theorem, or the full continuum cell-cover proof of Lemmas 5.2–5.4 inside Lean 4; those analytical steps remain in [6].

2 Exact Stage 4 Rational Functional

To guarantee self-contained auditability solely from this manuscript, we record the exact piecewise-rational formulas of [6] (Eqs. (4.1)–(4.8) and Lem. 5.1(1)) implemented

*Independent Researcher. Code, Lean 4 proofs, and certificates: MIT License; manuscript and figures: CC-BY-4.0. Prepared with transparent AI coding, formalization, and drafting assistance via Google Antigravity; all Lean 4 theorems, exact-$\mathbb{Q}$ verifiers, and adversarial tests were independently compiled and verified locally. Repository: github.com/lluiseriksson/cogentic-maximin-kite-nash-certificates.

verbatim in `src/kite_exact.py`. For $(z, c_1, c_2) \in [1/4, 4]^3$ and $u_+ := \max(u, 0)$:

$$f(z) := \begin{cases} 1, & z \in [\frac{1}{4}, 1], \\ \frac{4z+1}{5}, & z \in (1, 2], \\ \frac{9}{5}, & z \in (2, 4], \end{cases} \tag{1}$$

$$\lambda_K(z, y) := \tfrac{f(z)}{128} \min\big(1, 8(z - \tfrac{7}{8})_+\big) \times \big(1 + \min(1, 4(y - z)_+)\big),$$

$$\Lambda(z, y) := \tfrac{f(z)}{8} + \tfrac{3(y + f(z)z) + (y + f(z)z - 2f(z))_+}{32} + \tfrac{4(y - f(z)z)_+}{32} - \tfrac{(y-z)_+}{8} - \tfrac{f(z)z}{5} + \lambda_K(z, y). \tag{2}$$

Writing $f_0 = f(z)$, $A := (c_2 + f_0 c_1 - 2f_0)/2$, and $B := (c_2 - f_0 c_1)/2$, the closed-form integral $J(f_0; c_1, c_2)$ and its piecewise-linear envelope J_{mid} satisfy $J \le J_{\text{mid}}$ (Prop. 4.1(1)) with equality whenever $AB \ge 0$:

$$J(f_0; c_1, c_2) = \begin{cases} 0, & A \le 0,\ B \le 0, \\ \frac{c_2 - f_0}{16}, & A \ge 0,\ B \ge 0, \\ \frac{(c_2 + f_0 c_1 - 2f_0)^2}{64 f_0 (c_1 - 1)}, & A > 0 > B, \\ \frac{(c_2 - f_0 c_1)^2}{64 f_0 (1 - c_1)}, & A < 0 < B, \end{cases} \tag{3}$$

$J_{\text{mid}} := \frac{(c_2 + f_0 c_1 - 2f_0)_+ + 2(c_2 - f_0)_+ + (c_2 - f_0 c_1)_+}{64}$, and

$$F(f_0; c_1, c_2) := \tfrac{f_0 c_1 - c_2}{8} + \tfrac{3(c_2 + f_0 c_1)^2 + (c_2 + f_0 c_1 - 2f_0)_+^2}{64 f_0} - \tfrac{4(c_2 - f_0 c_1)_+^2}{64 f_0} + J + \tfrac{(c_2 - c_1)_+^2}{16} - \tfrac{f_0 c_1^2 + c_2^2}{10}. \tag{4}$$

Finally, with variance term $E_{\text{var}}(z; c_1, c_2)$ equal to $\min\big(\frac{5}{1536}, \frac{5}{162}(\frac{c_1+c_2}{2} - \frac{1}{4})_+^3\big)$ when $z \le \frac{3}{4}$ and $c_1 + c_2 \le 2$, equal to $\frac{5}{1536}$ on the rest of $z \le \frac{7}{8}$, and $\frac{5f(z)}{6144}$ for $z > \frac{7}{8}$, the Stage 4 functional is

$$H(z, c_1, c_2) := F(f_0; c_1, c_2) - \Lambda(z, c_2)(c_1 - z) - \Big(\tfrac{1}{8} - \tfrac{c_2}{80}\Big)(z - c_2) + E_{\text{var}}. \tag{5}$$

Replacing J by J_{mid} yields the Lemma 5.1(2) upper bound $H_{\text{up}} = G_{\text{mid}}(z, c_2) + h_{\text{comb}}(c_1) + E_{\text{var}} \ge H$.

3 Constructive Lean 4.35.0 Kernel

`lean/MaximinKiteNash.lean` compiles standalone in 3.2 s under Lean 4.35.0 [4] with zero Mathlib or external imports. Table 1 lists the exact formalized statement of every theorem.

Proposition 1 (Machine-Checked Kernel Soundness)**.** Every theorem in Table 1 compiles under Lean 4.35.0 without external dependencies, `sorry`, custom `axiom` declarations, or `Classical.choice`. In particular: (1) Theorems 1–4 and 7–8 certify the exact s-kite dichotomy (in-kite mixing to exact s-NE vs. escaped welfare cap $X + Y < 7/4$ and dual weight ratio $a \in [1/4, 4]$ at $s = 1/5$); (2) Theorems 5–6 and 9–11 certify the minimax regret screen, weak duality, denominator-D simplex rounding L_1 and remainder bounds, and 1/4-maximin anchoring; and (3) Theorems 12–18 certify the Sec. 2.3 step-parameter arithmetic and the core Stage 4 rational algebraic identities forcing $-1/3000 < -2^{-14}$.

4 Exact-$\mathbb{Q}$ Auditor `KITE-NASH-CERT-1.0`

`src/kite_exact.py` and `src/kite_certifier.py` use exclusively Python `int` and `fractions.Fraction`, statically checked by `scripts/verify_all.py` for zero occurrences of `float(`, `math.`, `numpy`, or `np.`. Raw JSON parsing uses `parse_float`, `parse_constant`, and `object_pairs_hook` rejecting all decimal literals, `NaN`/`Infinity`, and duplicate object keys, followed by a strict AST type whitelist, nesting-depth cap (20), ASCII-digit canonical lowest-terms rational parsing (`len` ≤ 2000, rejecting leading zeros, `-0`, `+`, and unreduced fractions), and duplicate probe rejection.

Definition 1 (`KITE-NASH-CERT-1.0` Acceptance Predicates)**.** A JSON witness with `schema="KITE-NASH-CERT-1.0"` is accepted iff all claimed exact rational/integer summaries match recomputed values and its mode predicate holds:

- **Mode 1 (`kite_best_response_and_welfare_cert`):** Given $s \in (0, 1/2)$, $R, C \in ([0, 1] \cap \mathbb{Q})^{m \times n}$, and $x \in \Delta_m, y \in \Delta_n$, computes exact (u_R, u_C, r_1, r_2). In `in_kite`, enforces $(1-s)r_1 + sr_2 \le s$, $sr_1 + (1-s)r_2 \le s$, exact Lem. 2.3(a) mixing $(x_{\text{out}}, y_{\text{out}})$ via verified pure best-response index, and $\max(r_1', r_2') \le s$. In `escaped_welfare_cap`, enforces escape of at least one kite face, strict cap $u_R + u_C < 2 - s/(1-s)$, dual multipliers $\theta_1, \theta_2 \ge 0$ $(\theta_1 + \theta_2 = 1)$ satisfying Cogentic's Lem. 2.3(b) dual separation $\theta_1((1-s)r_1 + sr_2) + \theta_2(sr_1 + (1-s)r_2) = (1-\lambda^*)r_1 + \lambda^* r_2 > s$, $\lambda^* = s\theta_1 + (1-s)\theta_2 \in [s, 1-s]$, and $a = \lambda^*/(1-\lambda^*) \in [s/(1-s), (1-s)/s]$.
- **Mode 2 (`minimax_screen_and_rounding_cert`):** Verifies exact zero-sum saddle points $\min_j(x_{\text{mm}}^T R)_j \ge v_R \ge \max_i(Ry_{\text{mm}})_i$ and $\min_i(Cy_{\text{col}})_i \ge v_C \ge \max_j(x_{\text{guard}}^T C)_j$; checks denominator-$D$ simplex rounding $c_k \in \{\lfloor Dp_k \rfloor, \lfloor Dp_k \rfloor + 1\}$, $\sum c_k = D$, $r = D - \sum \lfloor Dp_k \rfloor \in \{0, \ldots, d-1\}$, and $\|\hat{p} - p\|_1 \le d/D$; enforces either `early_halt` ($\max(v_R, v_C) \le s$, i.e., $v_R \le s \wedge v_C \le s$, with exact Lem. 2.2 minimax profile $(\text{halt_x}, \text{halt_y}) = (x_{\text{guard}}, y_{\text{mm}})$ having regret $\le s$) or `anchored_continue` (Row-oriented after Step 2: $v_R > s \wedge v_R \ge v_C$, $\tilde{x} = \frac{1}{4}x_{\text{mm}} + \frac{3}{4}\bar{x}$, and $\min_j(\tilde{x}^T R)_j \ge v_R/4 > s/4$).
- **Mode 3 (`stage4_H_algebraic_cert`):** For a nonempty, duplicate-free list of triples $(z, c_1, c_2) \in [1/4, 4]^3$ obeying the declared regime (`low_gate_z_le_1`, `high_gate_mid_1_to_2`, `high_gate_top_2_to_4`, or `mixed_cube`), evaluates Eqs. (1)–(5) exactly in $\mathbb{Q}$ and checks: (i) $J \le J_{\text{mid}}$ with equality when $AB \ge 0$; (ii) $H \le H_{\text{up}} = G_{\text{mid}} + h_{\text{comb}} + E_{\text{var}}$; (iii) $H(z, c_1, c_2) \le -1/3000 < -2^{-14}$; and (iv) Eq. (5.7) for $z \le 1$, high-gate

Table 1: Complete inventory of all 18 constructive Lean 4.35.0 theorems in `lean/MaximinKiteNash.lean` (zero `sorry`, zero `axiom`, zero `Classical.choice`; every theorem audits strictly to `[propext, Quot.sound]` via `lake env lean -j 1 AuditAxioms.lean`).

14	`stage4_cubic_Q_bound_eq5_3`	Eq. (5.3)	$27Q((4+u)/3) = -36 - 60u - 219u^2 - 60u^3$ $(\forall u \in \mathbb{Z})$ and $28 \cdot 477 = 13356 < 13400 = 536 \cdot 25$.
15	`stage4_subcase1b_discriminant_negative`	Lem. 5.2	$\forall s, D \in \mathbb{Z}$, $204(16(D-s)^2 - D^2) - 14(10D-17s)^2 = 2(830D^2 - 884Ds - 391s^2)$; at $\frac{10}{17}$ equals $\frac{2970}{119} > 0$.
16	`stage4_subcase1c_margin_eq5_8`	Eq. (5.8)	$5 \cdot 95 - 17 \cdot 64 = -613$, $1024 \cdot 95 = 1520 \cdot 64 = 97280 < 613 \cdot 3000$ $(-\frac{613}{97280} < -\frac{1}{3000})$.
17	`stage4_high_gate_breakpoints_order`	Sec. 5.3	$D \le z \le 2D \implies f_0(2-z) \le f_0 \le z \le f_0 z$ (all 4 cleared-integer inequalities for $f_0 = \frac{4z+D}{5D}$).
18	`stage4_final_contradiction_3000_vs_16384`	Thm. 5.5	$2^{14} = 16384 > 3000$ $(-\frac{1}{3000} < -2^{-14})$ and exact chain $\frac{1}{5} < \frac{1}{3} < \frac{3393}{10000} < \frac{3639}{10000} < \frac{3819}{10000} < \frac{3-\sqrt{5}}{2} < \frac{1}{2}$ (via $5 \cdot 10^8 < 22362^2$ and $2^2 < 5$).

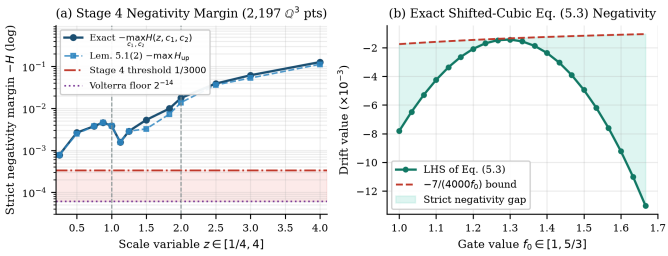

Figure 1: **(a)** Exact-$\mathbb{Q}$ Stage 4 negativity margin $-\max_{c_1,c_2} H(z, c_1, c_2)$ across all $13^3 = 2{,}197$ grid points on $[1/4, 4]^3$ (log scale), uniformly exceeding $1/3000$ (global tightest point $-1/1280$ at $(1/4, 1/4, 1/4)$) and separated by over an order of magnitude from the Volterra floor 2^{-14}. **(b)** Exact verification of the shifted-cubic drift bound Eq. (5.3) on $f_0 \in [1, 5/3]$.

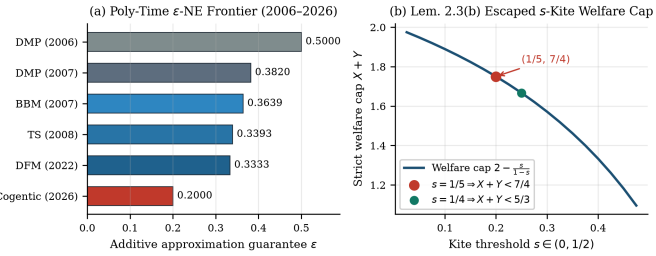

Figure 2: **(a)** Two-decade progression of polynomial-time additive ε-NE guarantees culminating at $1/5$ [6]. **(b)** Exact Lem. 2.3(b) strict welfare cap $2 - s/(1-s)$ forced upon escaping the s-kite, highlighting $(1/5, 7/4)$ and $(1/4, 5/3)$.

breakpoint order $f_0(2-z) \le f_0 \le z \le f_0 z$ for $z \in [1, 2]$, and Eq. (5.3) ($Q(f_0) < 0$) for $f_0 \in [1, 5/3]$.

- **Mode 4 (`bimatrix_one_fifth_ne_cert`):** Given $R, C \in ([0,1] \cap \mathbb{Q})^{m \times n}$, $0 < \varepsilon \le 1/5$, $x \in \Delta_m, y \in \Delta_n$, verifies $\max(r_1, r_2) \le \varepsilon \le 1/5$ (and $= 0$ for `exact_ne`) plus exact support sizes and lcm denominator.

5 Experiments, Certificate Atlas, and Red-Team Audit

All experiments were executed locally on Windows 11 (Python 3.12.6, Lean 4.35.0; 7-run means after warm-up).

1. 3D Exact-$\mathbb{Q}$ Stage 4 Grid Sweep. Evaluating Eqs. (1)–(5) over the $13^3 = 2{,}197$-point exact rational grid $z, c_1, c_2 \in \{\frac{1}{4}, \frac{1}{2}, \frac{3}{4}, \frac{7}{8}, 1, \frac{9}{8}, \frac{5}{4}, \frac{3}{2}, \frac{11}{6}, 2, \frac{5}{2}, 3, 4\}$ confirms $H(z, c_1, c_2) \le -1/1280 \approx -7.813 \times 10^{-4} \le -1/3000 < -2^{-14}$ at every single point (Fig. 1(a)), with the tightest slice at $z = 1/4$ ($-1/1280$), followed by $z = 9/8$ ($-481/307200 \approx -1.566 \times 10^{-3}$) and deepening smoothly to $-19583/153600 \approx -0.1275$ at $z = 4$. Every point also satisfies $H \le H_{\mathrm{up}}$ and $J \le J_{\mathrm{mid}}$.

2. Canonical 16-Certificate Atlas. Table 2 records all 16 canonical witnesses spanning Modes 1–4, verified in 0.104–2.564 ms (Fig. 3(a)). Mode 1 includes a zero-slack tight 1/5-kite row mix (`kite_row_mix_tight_1_5`: $r_1 = 1/4$, $r_2 = 0$, $(4/5)r_1 = 1/5$, output regret $1/5$) and escaped welfare-cap certificates at $s = 1/5$ ($3/2 < 7/4$, $a = 3/2$) and $s = 1/4$ ($6/5 < 5/3$, $a = 5/3$). Mode 2 covers both `early_halt` ($\max(v_R, v_C) \le 1/5$, including exact boundary $v_R = v_C = 1/5$) and `anchored_continue` (Row-oriented $v_R \ge v_C$, guaranteed floors $13/32 > 1/20$ and $43/160 > 1/20$) alongside exact denominator-D simplex rounding

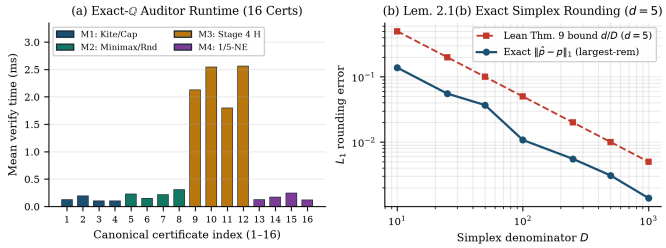

Figure 3: **(a)** Mean exact-ℚ verification latency across all 16 canonical certificates (0.104–2.564 ms). **(b)** Exact L_1 simplex rounding error $\|\hat{p} - p\|_1$ vs. the Lean Theorem 9 upper bound d/D ($d = 5$, $D \in [10, 1000]$).

Table 2: Canonical 16-certificate `KITE-NASH-CERT-1.0` atlas (`results/exp1_certificate_atlas.json`; all 16 verified).

`ne_one_fifth_4x4_zero_slack`	M4	4×4 zero-slack $r_1=r_2=\frac{1}{5}$, lcm=5	0.171
`ne_one_fifth_5x5_anchored_lp`	M4	5×5 `stage3_anchored_lp`, $\rho=\frac{1}{50}$, lcm=60	0.243
`ne_exact_equilibrium_3x3_rps`	M4	3×3 `exact_ne`, $\rho=0$, supp $(3,3)$	0.119

(Fig. 3(b)). Mode 3 certifies 48 distinct exact rational probes across all three gate regimes plus adversarial corners. Mode 4 certifies end-to-end 1/5-NE bimatrix profiles up to 5×5, including a zero-slack 4×4 profile with $r_1 = r_2 = 1/5$ and an exact Nash equilibrium ($\rho = 0$).

3. Live Adversarial Forgery & Integrity Gate. `tests/test_suite.py` runs 64 pytest checks (all passing in 0.11 s): all 16 canonical certificates, 3 raw-JSON IEEE-754/`NaN`/duplicate-key parser rejections, and 60 live adversarial forgery mutations spanning schema/parser bypasses (10), Mode 1 kite/dual tampering (14), Mode 2 saddle/rounding/anchor tampering (14), Mode 3 domain/regime/duplicate/margin tampering (12), and Mode 4 regret/stage/support tampering (10). `scripts/verify_all.py` passes all 5 gates including a strict axiom whitelist and 40-file SHA-256 manifest.

6 Conclusion

We delivered an independent, zero-dependency, zero-floating-point verification stack for Google Research Cogentic's exact polynomial-time 1/5-approximate Nash equilibrium algorithm [6], combining 18 constructive Lean 4.35.0 theorems (zero `sorry`, zero `Classical.choice`), the 4-mode exact-ℚ auditor `KITE-NASH-CERT-1.0`, 16 canonical certificates, a 2,197-point exact rational confirmation of $H \le -1/3000 < -2^{-14}$, and 60/60 live adversarial forgery rejections.
